

TQI *Atlas* SM

Problem Statement:

Digital transformation offers customers with the information needed to make better decisions and enables improved customer outcomes. To achieve this transformation, organizations must first understand their current data environment. Without this, organizations risk omitting critical data in their future state design and lack the ability to migrate data into the new solution. The **TQIAtlas**SM defines the “As-Is” data environment and identifies customer focused “To-Be” improvements enabling a roadmap to the future state solution.

The Benefit to The Government:

Our **TQIAtlas**SM process provides the government with a baseline of data modeling documents.

This enables:

Concise and complete documentation describing the current data environment.

A data model that will show all the interfaces and how the data will be communicating with all external applications.

Ability to map “As-Is” data with future proposed “To-Be” data to ensure that all critical needs will be met by the future out-of-the-box commercial-off-the-shelf solutions.
